Individual Reflection - Kwadwo Osafo
DS 5020 Mini Project 1

What I did:
As I was the only team member for this project, I was solely responsible for all decisions in the code and analysis, as well as the creation and upload of all files.

What I learned:
One thing that really stood out to me was how sparse the data was. I obviously expected some sparseness prior to analyzing and cleaning the data, but I did not expect >95% of the cells in the customer-by-product matrix to be empty. This highlights the importance of getting experience with real-life data, as sometimes it might not be intuitive to predict how the data will look like. I learnt a lot about the method and analysis sections, as this was a lot of work for a single person. Nevertheless, it was very helpful for me to have a set of rules and a well-defined list of objectives, which helped me structure my learning and how I wrote code.

What I would change next time:
Next time, I would try spacing my work a bit more, so that I have more time to deeply research the concepts that I am applying in my project. I will also consider working with a teammate who can help alleviate the workload.
